Tailwind CSS Setup for Production..

1. You have to create a separate folder for your work locally on your computer.

2. Open this folder in your VSCode .

3. Create a simple file of index.html and add basics mean "Html", "Header", "body", etc

4. To do setup for tailwindcss you must install NodeJS in your computer to download NodeJS link is here (https://nodejs.org/en/download/current) you can download latest version from here.

5. Open VSCode terminal and type the following commands to setup for production.

6. 1 npm init -y   // This initialize the directory as a NodeJS project

7. 2 npm install -D tailwindcss postcss autoprefixer vite   // installs required packages

8. 3 npx tailwindcss init –p

9. 4 you have to create a file "input.css" , add it to your html and add the following content to it   @tailwind base;

    @tailwind components;

    @tailwind utilities;

10. 5 in your tailwind.config.js file replace content: [ ], with content: ["*"],

11. 6 add "start": "vite" to your scripts in package.json instead of

```
"scripts": {
    "test": "echo \"Error: no test specified\" && exit 1"
  },
```

   Like that

```
"scripts": {
"start": "vite"
},
```

12. 7 open terminal and run this command " npm run start" this will start a live server for you

That's it, now enjoy Tailwind CSS
